PROVISIONAL INFORMATION ON SELECTED NOTIFIABLE DISEASES IN THE UNITED STATES AND ON DEATHS IN SELECTED CITIES FOR WEEK ENDED DECEMBER 14, 1963

PLAGUE - One case of plague was reported for the week ended December 14. The case, fatal, was reported from Arizona. No additional cases are known or suspected. (See Epidemiological Report, page 423).

This is the first case of plague reported in the United during 1963. It is also the first case since July and August 1961, when 3 cases were reported from New Mexico.

In the past 30 years, 36 cases of plague have been officially reported in the United States. California has reported 15, New Mexico 12, and Arizona 2 of these cases. (See table, page 423.)

DIPHTHERIA - A total of 21 cases of diphtheria were reported for the week ended December 14. This brings the

cumulative total to 281 cases thus far in 1963 and represents the lowest number of diphtheria cases ever recorded for the country. For a comparable period in 1962, 444 cases were reported.

Of this week's cases, 13 were reported from Oklahoma. All 13 cases occurred in Adair County, and had onsets from late October through early December. An epidemiologic report is included in this issue on page 422.

Oklahoma thus far in 1963 has reported a total of 20 cases of diphtheria, which makes it third highest in the nation. Louisiana has reported 33 cases (12 percent of the national total), Florida has reported 24 cases (9 percent.) Oklahoma's 20 cases account for 7 percent of the national total.

EPIDEMIOLOGICAL REPORTS

Diphtheria - Oklahoma

An epidemic of diphtheria, with 13 clinical cases, including 2 deaths, occurred in Adair County, Oklahoma, between late October and early December. An additional 12 carriers were discovered in the course of investigation.

The epidemic was discovered when 2 brothers (Cases 5 and 6) were hospitalized in Arkansas with membranous pharyngitis in early December. Diphtheria was suspected clinically, and confirmed by culture. Then, it was learned that an older sister (Case 3) had experienced a sore throat in early November. She was treated with penicillin; the pharyngitis appeared improved. Three days later, however, she developed cardiac failure. She died 13 days after the onset of her illness. An autopsy was not performed. Diphtheria was not suspected.

A physician remembered a 13-year-old girl (Case No. 1) whom he had treated with penicillin for a severe sore throat in late October. Cultures, taken prior to antibiotic therapy, were interpreted as growing normal flora; cultures were not taken specifically for diphtheria. Despite antibiotic therapy for 6 days, she developed nasal regurgitation and a cardiac arrhythmia. She died 11 days after the onset of symptoms.

These 2 fatal cases had attended the same school,

where a D-P-T immunization drive had been held during the fall. A 90 percent response of school age children resulted; the 2 girls were among the 10 percent not receiving vaccine.

After the first case in Family B was recognized, a nurse went to the home to immunize the remaining family members.

Intensive investigations by health department authorities have subsequently revealed 9 additional cases, all but two of whom thus far can be traced to direct or indirect contact with recognized cases. Notably, 6 of the 13 cases occurred in a family of 13 children. Of the 13 cases, 11 had not received primary immunization; 2 were inadequately immunized (no booster dose within the past 4 years).

Oklahoma Public Health officials cultured all students at the 2 schools and all known contacts. Of 12 carriers detected, most were siblings or close contacts of the known cases.

A county-wide immunization program was held when the epidemic was recognized. Approximately 7,000 of the county's 13,000 residents responded.

(Reported by Dr. Kirk T. Mosley, Commissioner of Health, Oklahoma State Department of Health, and an EISOfficer.)

In the past 30 years, 36 cases of plague have been officially reported in the United States.

All of New Mexico's 12 cases have occurred since 1949, and account for 63 percent of the nation's total of 19 cases
during the past 15 years.

Plague - Arizona

The case of bubonic plague reported for the week ended December 14 occurred in a 28-year-old male, Indian sheepherder, who resided in Houck, Arizona. He died in the Gallup, New Mexico, Indian hospital, December 7.

On December 1, the patient had killed and skinned a wild rabbit near his home in eastern Arizona. He fed the rabbit to his dog. Four days later, he experienced the onset of fever, malaise, and generalized toxicity. He was admitted to the Gallup Indian Hospital on December 7. On admission to the hospital, a large node, believed to be a bubo clinically, was discovered in his left axilla. He died 5 hours after admission.

Blood cultures taken both before and after death have

yielded Pasteurella pestis. Mice, which had been injected with his blood samples, died quickly. The diagnosis was confirmed by fluorescent antibody study, agglutinations and hemorrhagic lesions in guinea pigs considered typical for P. pestis, at the U. S. Public Health Service Plague Laboratory in San Francisco. P. pestis has been confirmed on culture at the New Mexico Public Health Laboratory.

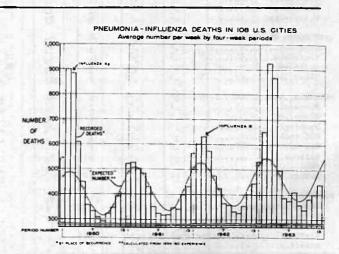

There are no additional cases of suspected plague in Arizona. Further field investigations are in progress. (Reported by Dr. Lloyd M. Farner, Commissioner of Public Health, Arizona State Department of Health; Dr. Leo D. Okane, New Mexico Public Health Laboratory; and the CDC Plague Laboratory, San Francisco.)

SUMMARY OF PNEUMONIA AND INFLUENZA DEATHS

The weekly average number of pneumonia-influenza deaths for the four-week period ending December 14 was 439 as compared with an expected weekly average of 502.

Dengue Fever - Puerto Rico

During the week ended December 14, 1,278 cases of dengue-like illness were officially reported to the Puerto Rico Department of Health. This brings the 1963 total to 24,150 cases.

(Reported by Rafael Timothee, M.D., Director, Preventive Medical Services, Puerto Rico Department of Health, and a team from the Communicable Disease Center.)

In addition to the established procedures for reporting morbidity and mortality, the Communicable Disease Center welcomes accounts of interesting outbreaks or cases. Such accounts should be addressed to:

> Lawrence K. Altman, M.D., Editor Morbidity and Mortality Weekly Report Communicable Disease Center Atlanta, Georgia 30333

INTERNATIONAL NOTES - QUARANTINE MEASURES

Dengue Fever - Jamaica

For the week ended November 30, 88 cases of dengue fever were officially reported in Jamaica. These cases bring the cumulative total to 1,326 thus far in 1963. (Reported by Dr. Ruth Puffer, Pan American Health Organization, Washington.)

Poliomyelitis - Peru

A total of 274 cases of paralytic poliomyelitis were admitted to hospitals in Lima and Callao, Peru, during an epidemic which began in July and reached its peak in late September and early October.

According to the date of admission to the hospitals, 46 cases occurred in July, 60 in August, 72 in September, 96 in October, and 30 during the first half of November.

The 274 cases reported from July through October compare with 133 cases for the comparable period of 1962. (Reported in Weekly Epidemiological Report, Pan American Sanitary Bureau, December 4, 1963.)
